SQL Server Performance for Developers

For the .NET programmer, Visual Basic programmer or PHP programmer, if you are accessing a SQL Server database there are some things you should know to performance tune your queries. Learn how to improve query performance with Indexes, how to properly use parameterized queries, using the query analyzer, and avoiding common SQL Server performance pitfalls.

This presentation is a lot of fun. This is one of the few presentations where there is audience participation. Four luck participants will be selected to help simulate the work that SQL Server does when accessing tables structured with different types of indexes.
