TSQL Pivot Table

TSQL Pivot Table? What's that?

Here is a quick sample of how to implement a pivot table in TSQL for SQL Server. The example below creates a database called pivot, you probably already have your own database to work in. Then it creates a table called REVENUE and fills it in with department revenue for just over a 10 year period. Then you see a couple simple select statements followed by a SELECT statement that pivots the data.

TSQL Pivot Table examples

Just to recap, here is the actual pivot code, and the output that the TSQL Pivot Table produces.

I hope you find this useful as an example of working with a TSQL Pivot Table in SQL Server using the select statement. For this and other examples, see the 70-461 training material and other TSQL related posts on this site.
