4 Sessions Submitted to Seattle Code Camp

It has been a busy week getting ready for SQL Saturday Vancouver, planning sessions to present at future training's and determining new material to present.

Today I submitted 4 sessions to Seattle Code Camp for their June session.

- Using SSRS 2012 Reports to Analyze **SQL Server** Health
- Unleashing Common Table Expressions in **SQL Server**
- **SQL Server** Performance for Developers
- What's New in **TSQL** 2012

My new favorite is the What's New in **TSQL** 2012. Here is the abstract...

What's New in TSQL 2012

SQL Server 2012 introduces over a dozen new **TSQL** enhancements that will make the job of a developer writing queries much easier. This session will explore the details and functionality around the new **TSQL** functionality introduced in **SQL Server** 2012. This will include TRY_CONVERT, OFFSET / FETCH, **FORMAT**, **SEQUENCE**, **THROW** exception, sp_describe_frist_set, **DATEFROMPARTS**, CHOOSE, **IIF**, CONCAT, **PARSE**, TRY_PARSE, and more. Improve your queries and productivity by learning what you need to take advantage of these new **TSQL** features today.

I guess now I wait to see if I get accepted, either way I take what I learn at SQL Saturday Vancouver this weekend, and add to the first 2 sessions, and then get the Whats new in **TSQL** 2012 going soon.
