

Microsoft SQL Operations Studio

Today at PASS Summit Microsoft announced a new SQL "Tool" for running queries against SQL Server, called the Microsoft SQL Operations Studio.

So what is the Microsoft SQL Operations Studio

This appears to be a new cross platform (Mac, Linux, and Windows) for running queries against SQL Server.

Perhaps this is a replacement for SQL Server Management Studio, or may just a subset of what SSMS does today, however it works cross platform, unlike SSMS.

This is the "free modern data operations tool for SQL everywhere"

Doing a quick search I wasn't able to find any reference to this yet, so this is brand new and not even released yet.
