Slow CheckDB - What do you do?

There are many times that CheckDB ends up being extremely slow, sometimes taking more than a day to run. This can make life difficult if you are trying to find out what is corrupt.

There are several of the tricks that I use to speed up DBCC CheckDB, depending on the specific environment. What I am looking for is what others do when they need to run DBCC CheckDB on a big database that appears to take forever to complete?

All answers posted by the end of Database Corruption Challenge 6 will earn an extra point in the Database Corruption Challenge. As part of the Database Corruption Challenge it is not feasible for me to create a 3TB database file and expect anyone to want to download it for the challenge. I would love to do that, however I don't think anyone would participate in the Corruption Challenge if you had to download a 3TB file.

So, what have you done speed up DBCC CheckDB, and why?
