Day 10 – Server Overview

With the server overview page you can keep close tabs on some of the key performance indicators for a SQL Server. The details on this page apply not to a single database, but instead to the entire SQL Server instance.

The server overview page gives you a quick rundown of the following:

- Historic Waits
- Plan Cache

- CPU By Database
- Server Connections
- Page Writes / Second
- Page Reads / Second
- Waits
- One Time Use Queries
- Queries Needing Parameters

The gray buttons in the middle of the page are all the instance level reports. These instance reports are some of the quickest ways to evaluate the overall status of your entire SQL Server.
