

Week 4 Corrupt Database

What you are given:

The full backup file after the corruption occurred. That's it this week, let's just say this database didn't have the best backup and restore schedule in place. There is one backup file, a full backup containing the corruption. I wish I had some transaction logs, and I wish I had a backup from before the corruption, but I don't. That's part of making this more diabolical than the last challenge.

Download the corrupt database files here: [CorruptionChallenge4.zip](#)

When restoring, you may need to use the **KEEP_CDC** flag on your restore.
