Database Health Monitor Version 2.4.1 Released

Just one day after releasing Database Health Monitor version 2.4, today I released version 2.4.1.

Version 2.4.1 includes a bug fix and 2 new feature that were added after the release of version 2.4.

- Feature: Support for SQL Server 2016. Since SQL Server 2016 officially released yesterday, Database Health Monitor now supports SQL Server 2016.
- Bug: The check for the latest version of SQL Server 2014 CU6 was updated. Microsoft released a patch to their original CU6 release. The check now accounts for this.
- The QuickScan report now has an option to ignore specific check items. This was a customer request that I received today. To ignore, or un-ignore items right click on the quick scan report.
