Database Health Monitor - June 2023 update

Today I have release the June 2023 update of Database Health Monitor version 1018. The big focus on this update was the wait time involved in reconnecting to SQL Servers when there are many connections open. This has been a big improvement. There were also some licensing updates with additional options for licensing, and more details for those who in the trial mode without a license.

Here is what is new:

June 2023 – Version 1018 Release Notes

New Features

- Updated the licensing page to make it look less like an html 1.0 web page. Added updated links to purchase the product, and informative details.

- Sped up the reconnect process. Previously if the application sat for more than 24 hours, the first click would cause all the database connections to refresh. That has been updated to happen during off hours, and when you click on the program for the first time after sitting for 24 hours it should be active immediately rather than waiting for SQL Server to reconnect. Massive speed improvement.

- For databases that show up in the tree view as “disconnected”, when you click on one of those it attempts to reconnect. This is handy as the only way to that before was to refresh the entire tree view which would reconnect all databases.

Other Items

- Updates to the licensing, and additional options for points.

You can register and download the latest version here:
