Preventing Server Corruption

Anyone who's experienced database corruption knows they do not want it to happen again. Corruption repair is stressful and could require money and downtime you can't afford. In some cases, there is no "repair" just rebuild. Unfortunately, no database is immune from server corruption, but there are certain alerts and specific practices that when implemented will greatly lessen the impact of corruption. In this short 15-minute video, Steve Stedman and Derrick Bovenkamp will explain what to implement and to have in place incase corruption hits.
