Recursive CTE to Calculate Dates for the Last 30 Days

Have you ever needed to generate a list of dates for the last 30 days. There are lots of different ways to do this with TSQL, but one way is with a CTE, where you can then left join against it with another query to generate a list of all dates in a result set, along with the dates for the last 30 days that aren't in the result set.

Which creates this list.

Just a quick CTE that can be very useful when generating a report.

Enjoy...
