SQL Server DBCC Commands: DBCC DLLNAME

DBCC DLLNAME is a database console command (DBCC) in Microsoft SQL Server that can be used to display the name of the dynamic-link library (DLL) file associated with a specific database console command (DBCC). Displaying the DLL file name can be useful for troubleshooting issues or for verifying the version of a specific DBCC command.

To use DBCC DLLNAME, you must specify the name of the DBCC command you want to display the DLL file name for.

Here is an example of how to use DBCC DLLNAME to display the DLL file name for the DBCC CHECKDB command:

```
-- Display the DLL file name for the DBCC CHECKDB command
DBCC DLLNAME ('DBCC CHECKDB');
```

The output of DBCC DLLNAME will be a message displaying the DLL file name associated with the specified DBCC command.

It is important to note that DBCC DLLNAME is a read-only command and does not allow you to modify the DLL file associated with a DBCC command.

DBCC DLLNAME is a useful tool for displaying the DLL file name associated with a specific DBCC command in SQL Server. It can be useful for troubleshooting issues or for verifying the version of a specific DBCC command.
